CREATOR STUDIO

VoxBot User Manual

USER MANUAL

App: https://aetherwavestudio.com/voxbot (also the home page: `/` and `/home`)
Reached from: the AetherWave logo on any page, VoxBot on the left rail, VoxBot Chat in the grid menu
Version: 1.0 · November 2026
Every control named in this manual exists in the app today (checked against the live code, main `36ef901eb`, 2026-11-15).

AetherWave Studio · generated 2026-11-15

The idea in one paragraph

VoxBot is the AetherWave Studio assistant, and it is the first thing you see when you sign in. It is a chat, but it is wired into the platform: ask it a question and it can search the web and show its sources; ask it to make something and it makes it right there in the conversation, an image, a video, a song, a voiceover, or a finished web page. Anything that costs credits shows you the exact price on a card first, and nothing runs until you tap **Confirm**. Your chats are saved, you can organise them into projects, every page it builds stays findable in the Files panel, and you can make it yours with a name, a picture, a voice and expert skills.

Part 1 - Getting started

- **Sign in to chat.** Signed-out visitors see "Sign in to chat with VoxBot" and a **Sign in** button, which brings you straight back to VoxBot.
- The empty chat greets you with **"What will you make today?"** Below the message box are idea cards in four tabs: **Pages & files**, **Music & video**, **Art & merch** and **Ask VoxBot**. Use **More ideas** and **Back** to page through them. Cards that build a page show their credit price.
- Under the cards is a row of apps (**Quick Create**, **Music Studio**, **Image Studio**, **Video Studio**, **UGC Studio**, **Brand Studio**, **Feed**) and **Show more** for the full list.
- Type in the box (placeholder **"Ask VoxBot anything"**) and press **Enter** to send. **Shift+Enter** adds a new line. While a reply is coming in, **Send** becomes **Stop**.

Fast and Smart

The menu at the top of the chat picks who answers:

Choice	Model	Use it for
VoxBot · Fast	Claude Haiku 5.5	Quick answers, most everyday questions
VoxBot · Smart	Claude Sonnet 5.5	Long briefs, careful plans, anything easy to get subtly wrong

Your choice is remembered next time. Page builds always use Smart, whatever is selected.

Part 2 - What it costs

Chat messages come in two kinds, **Fast** and **Smart**, and each plan gets its own free messages every day. Fast and Smart are counted separately, so a Smart message never uses up a Fast one.

Your plan	Free Fast messages a day	Free Smart messages a day
No subscription (credit packs included)	20	none: Smart uses 3 credits from the first message
Starter	20	5
Studio	30	10
Artist	Unlimited	20
Producer, Mogul, Ultimate	Unlimited	200, then Smart pauses until the next day

After your free messages, a message costs:

	Credits
A **Fast** message	1
A **Smart** message	3
Each **web search** inside a paid message	3 (up to 3 per message)

- **Web searches on free messages are included.** Without a subscription a free message can run 1 web search; on any plan it can run up to 3.
- **You always see the price before you send.** A small tag beside **Send** shows what your next message costs: **"Free, 4 left today"**, **"Included"**, **"1 credit"** or **"3 credits, plus 3 per web search"**. It changes the moment you switch between Fast and Smart. When your free messages run out, a line above the message box says so before you send.
- The line at the bottom of the sidebar shows your plan's allowance, for example **"Included today: 30 Fast and 10 Smart messages."**
- Free messages reset at **00:00 UTC**. Every signed-in member gets them, including members who have not added a card.
- Past your free messages, chat keeps working at the prices above as long as you have credits. On Producer, Mogul and Ultimate, Fast is unlimited and only Smart pauses after 200.
- A paid reply shows its cost underneath it. If a reply fails, nothing is charged.
- Making things (images, video, music, pages) is priced per job, the same as in the studios. See Parts 5 and 6.

> **Good to know:** a single message can be up to 8,000 characters. A very long reply stops at a length limit and says "Ask us to continue"; just ask.

Part 3 - The left sidebar: chats and projects

From the top, the sidebar holds: **Search chats**, your **Support Chat**, **PROJECTS (+)** and **CHATS (+)**. At the bottom are **Customize VoxBot**, your plan's free-message line and the light/dark theme button.

Search

Type in **Search chats**. Chat titles filter as you type, and from two characters VoxBot also searches the words inside your chats and shows a matching snippet, including chats too old to appear in the list. **Escape** clears the search.

Chats

- The **+** on the **CHATS** heading starts a new chat.
- Chats are grouped **Pinned**, then **Today**, **Yesterday**, **Previous 7 days** and **Older**.
- A new chat is named after its first message. Rename it any time.
- Each chat has a **3-dots** menu:
  - **Pin chat** / **Unpin chat** keeps it at the top.
  - **Move to project** files it into one of your projects (or back to **No project**).
  - **Rename** (up to 120 characters).
  - **Delete chat** removes the chat and its messages, including any pages built in it. It asks first, and it cannot be undone.
- The address bar remembers the open chat, so a reload brings you back to it.

Projects

A project is a folder for chats: one release, one client, one campaign.

- The **+** on the **PROJECTS** heading creates one. Names are up to **60 characters**; you can have up to **100 projects**.
- Tap a project to open or close it. A count shows how many chats it holds.
- Each project has a **3-dots** menu:
  - **New chat in this project** starts a chat that is filed into the project when you send its first message. A pill above the message box shows which project it is going to; tap its **X** to cancel.
  - **Edit name** renames it in place. **Enter** saves, **Escape** cancels.

    - **Colour:** pick a colour (or none) to tint the project in the sidebar, so you can spot it without reading.
    - **Delete project** asks first. **The chats inside are kept** and move back to your other chats; deleting a project never deletes your work.
- Both headings collapse, so you can fold away whichever section you are not using.

Hiding the sidebar

On a computer, **Hide sidebar** gives the chat the full width; **Show chats** brings it back. On a phone the sidebar is a drawer: tap the menu button to open it, and pick a chat or tap outside it to close.

Part 4 - The message box

Image, Video and Music

Under the message box are three chips. Turn one on and your next message becomes a request to make that thing, so you only have to describe it. A row of settings appears beside the chip you turn on:

Chip	Settings
Image	**Speed** (Grok Imagine, quick, 2 images) or **Quality** (GPT Image 2, one detailed image); aspect **1:1**, **3:2**, **2:3**, **16:9**, **9:16**
Video	**480p** or **720p**; **6s**, **10s** or **15s**; aspect **16:9**, **9:16**, **1:1**, **3:2**, **2:3**
Music	**Vocals** or **Instrumental**; with vocals, **Any voice**, **Female voice** or **Male voice**

Your choices show as small labels on your message, and the chip turns itself off after sending. VoxBot remembers your settings for next time. You still see a price card before anything is made (Part 5).

The + menu

- **Add Images** and **Add Files** attach from your device.
- **From My Gallery** attaches images you have already made on AetherWave.
- **Create Images**, **Create Music** and **Create Video** open the full studio in a new tab, carrying over what you have typed.

Attachments

You can also **drag and drop** files onto the chat, or **paste** a screenshot or copied file. Pasted text stays text.

Kind	Formats	Limit
Images	JPG, PNG, WebP, GIF	10 MB each, up to 5 per message
PDF	PDF	10 MB, up to 100 pages
Text	TXT, MD, CSV	1 MB
Songs	MP3, WAV, M4A, AAC, FLAC, OGG	100 MB
Videos	MP4, MOV, WEBM	500 MB

Up to **5 images and 3 other files** per message.

- **Images, PDFs and text** are read in the conversation. VoxBot can describe a picture, pull figures out of a PDF, rewrite a document, or use an image as the reference for something it makes.
- **Songs and videos** upload straight to your storage (you see "Uploading N%") and are **saved to your gallery**, ready to use here or in any studio. They use storage space, not credits.
- Every image is checked by moderation before it is used.

Talk instead of typing

On Chrome, Edge and Safari there is a **microphone** button. Tap it and talk; your words are typed into the box. It never sends on its own: you press **Send**.

Edit your last message

Tap the **pencil** under your newest message to change it and send it again. Your attachments are kept. Editing counts as a message.

Part 5 - Making images, video and music

Ask in plain words, or use the chips. "A square cover for this track, neon city at night." "Turn this photo into a 9:16 video." "A dark synthwave instrumental." VoxBot picks the tool and settings (or uses the ones you name) and answers with a **confirm card**.

The confirm card

- What will be made: for example **"2 images, Grok Imagine, 1:1"** or **"6s video, 720p"**, plus the prompt it will use.
- The **exact credit price**, roughly what that is in dollars, and when it is charged (at start, when the song is ready, or on success).
- **Confirm** and **Cancel**.
- **"Nothing is made or charged until you confirm."** A card expires after about **10 minutes**; just ask again.

VoxBot cannot spend your credits on its own, and the price on the card comes from the same price list the studios use.

What it can make from the chat

Ask for	Typical price	Charged
Images (Grok Imagine, 2 images)	6 credits	At start
Images (GPT Image 2, one detailed image)	9 credits at 1K, 12 at 2K	At start
Edit an image you give it	The Image Studio price	At start
Upscale an image (2x, 4x or 8x)	The Image Studio price	At start
Remove a background (transparent PNG)	The Image Studio price	At start
Extend an image to a new shape	12 credits	At start
Video, from text or an image (1 to 30 seconds)	Grok: about 4 credits a second at 480p, 7 at 720p	At start
A song (Suno, two tracks, with or without your lyrics)	20 credits	When the song is ready
AI Mastering of a track	20 credits, included on Artist, Producer, Mogul and Ultimate	At start
A voiceover from your text (up to 1,000 characters, 9 voices)	5 credits per 1,000 characters, minimum 2	At start
Merch print-ready design / mockup	1 / 3 credits	At start
Comic panels for a comic you have started	The comic's per-panel price	On success

- **Use your character.** If you have made a character in UGC Studio, VoxBot can put them in an image.
- **One creation per message.** For a chain ("a song, then cover art, then a video"), confirm one step, then ask for the next.
- The card becomes a progress card ("Generating...", "Rendering... this can take a few minutes."), then shows the finished images, video or both song tracks with **Download** / **Download all** and **Open gallery**.
- **Results are saved to your gallery.**
- **If a job fails, any charge is refunded.** Before paying to run a slow video again, check your gallery: a late render often lands there anyway.

- **After a song,** VoxBot offers **Make more with this song**: **Make cover art**, or **Make a lyric video** (from 20 credits) in Quick Create.

If you have not added a payment method or are out of credits, the card shows **Add a payment method or get credits** with a one-tap link to a credit pack.

Part 6 - Building pages and files

VoxBot can write a complete, self-contained HTML file for you: not a snippet, a finished page you can open, host or send on. Ask for one, or tap a card under **Pages & files**. If your request is short, VoxBot asks a question or two first (who it is for, what a visitor should do). Then you get a confirm card with the flat price.

Build	Credits	What you get
Landing page	55	A one-page site for a release, an artist, a product or an event
Slide deck	55	A presentation as one HTML page; arrow keys, a tap or the buttons move between slides
Professional EPK	55	An electronic press kit featuring your AetherWave gallery
Motion graphics presentation	65	An animated presentation that plays in the browser
HTML game	85	A playable browser game with keyboard and touch controls
Researched newsletter	120	VoxBot researches the topic on the web, then writes email-ready HTML plus a plain-text version

How a build runs

- After **Confirm**, the card shows **"Writing your landing page… this usually takes 1 to 3 minutes. Keep this page open."** and a live count of how much is written. **Stop** cancels it.
- **You are charged only when the finished file arrives.** A build that fails, is stopped, or runs out of room costs nothing.
- **Builds are always paid**, at the same price on every plan, and never use your free messages.
- One build at a time. Your brief can be up to **4,000 characters**: give it the real names, lines and dates, the look you want, and what a visitor should do.
- When it is ready: **"Ready. Preview it here, then download the HTML file."** You get a live preview with **Download HTML**, **Full screen** and **Reload preview** (the newsletter adds **Download plain text**).

> **If a build runs out of room:** "The build ran out of room before it finished. Nothing was charged." Ask for something simpler (fewer sections, less animation). Retrying the same brief usually hits the same ceiling.

What the files are

- **Slide decks** are one HTML page, not PowerPoint. To share as a PDF, open the file in a browser, print, and choose Save as PDF; each slide prints on its own page.
- **Motion graphics** play in the browser; they are not a video file.
- **The newsletter** is not sent by VoxBot; paste it into your email tool.
- **The EPK** uses what you tell VoxBot and your gallery. Where a press quote or booking email is missing it leaves a marked placeholder instead of inventing one.
- **Builds are not saved to your gallery.** They live in the chat that made them, and the Files panel finds them for you (Part 7).

Part 7 - The Files panel (right side)

Every page VoxBot builds is kept with its chat and its project, and the **Files** panel brings them back without scrolling.

- Open it with the **folder** button at the top right of the chat. It slides in from the right (full width on a phone). Close it with **X**, **Escape** or the folder button.
- Two scopes:
  - **This chat:** the builds made in the conversation you are in.
  - **Project:** every build from every chat in this chat's project, each labelled with the chat it came from. Available when the chat is in a project.
- Each file shows its type, the brief it was made from, when it was made and its size, newest first.
- **Open** shows the file in a preview with **Download HTML**, **Full screen** and **Reload preview**. **Download** saves the `.html` straight away.
- The panel only ever shows your own builds.

Images, video and songs are not listed here because they are already in your gallery.

Part 8 - Make VoxBot yours

Click **Customize VoxBot** at the bottom of the sidebar. The window, **Customize your VoxBot**, says it plainly: "Give it a name, a picture and a voice. It is still VoxBot underneath."

- **Name:** 1 to 24 characters (letters, numbers, spaces and simple punctuation), then **Save**. Names that could be mistaken for AetherWave staff, such as "Admin", "Support" or "AetherWave", are not allowed.
- **Picture: Upload image** (JPG, PNG, WebP or GIF, up to 10 MB) or **From my gallery**. Every picture is checked before it is saved. A character you made on AetherWave works well.
- **Voice:** the voice VoxBot reads its replies in. Nine voices; the default is Katie. Tap **Hear it** for a sample. It saves as soon as you pick.
- **Skills:** see below.
- **Reset to VoxBot** brings back the original name and picture. Your voice and skills stay.

Your name and picture show across the page. Everything here is saved to your account and follows you to your other devices.

Skills

A skill is an expert briefing, written by the AetherWave studio, that VoxBot works to when the job calls for it. In **Customize VoxBot**, under **Skills**, tap **Connect** on any skill; tap **Connected** to turn it off again. It saves straight away.

Eleven skills are available. Four of them also shape a page build:

Skill	What it does	Also shapes
Web Designer	Designs pages with a real grid, type scale and colour system instead of default styling	Landing pages, EPKs, slide decks
Motion Graphics	Animates with proper easing, timing and scene transitions instead of plain fades	Motion graphics presentations
Video Game Developer	Builds games with a fixed timestep loop, responsive controls and real game feel	HTML games
Newsletter Editor	Writes issues with a through-line, a real subject line and sourced claims instead of a list of links	Researched newsletters

The other seven sharpen VoxBot in chat, for planning, writing and feedback:

Skill	What it does
Ad Designer	Builds ads around one offer and one action, composed for the placement they will run in
UGC Video Director	Writes hooks and spoken lines that sound like a person talking, not a script being read
Video Director	Plans shots that cut together: coverage, continuity and a reason for every angle
Songwriter	Writes to structure and prosody, so the hook lands where the music wants it
Brand Media Expert	Holds one voice across every surface: palette, type, tone and what never to do
Mastering Engineer	Targets real loudness and dynamic range, and says what a master cannot rescue
Album Art Director	Designs covers that still read at thumbnail size, with type that survives the crop

- **Skills are free** and do not change the price of a message or a build.
- In builds, a matching skill goes into the brief, so the file comes back built to that standard. Every build type has exactly one skill that shapes it.
- In chat, VoxBot draws on a connected skill when it is useful, which usually shows up as sharper questions before it starts.
- Connect as many as you like; each is used only for the work it fits.

Part 9 - Every reply

Under each VoxBot reply:

- **Copy** the reply. Code blocks have their own **Copy**, and HTML code also gets **Download .html**.
- **Read aloud** in your VoxBot voice; tap again to stop. Free, with limits: 30 replies an hour and 150 a day, and very long replies are read up to about 1,500 characters.
- **Good reply** / **Bad reply** thumbs tell the team how it did. Tap the same thumb again to take it back.
- **Regenerate** (newest reply only) asks again. It counts as a message.
- **Sources:** when VoxBot searched the web, the sites it used appear as chips under the reply. It can also read a page when you paste a link.

A down arrow appears when you scroll up, to jump back to the latest message.

Ask about your account

Ask how many credits you have, what plan you are on, how many free messages are left, what you made recently, or what something costs right now. VoxBot reads your live account and current prices instead of guessing.

Part 10 - Support Chat

Support Chat is pinned at the top of your sidebar. It is also the chat bubble on every other AetherWave page.

- It answers from the AetherWave Help Center.
- If something is broken or needs a person, it can draft a **support ticket** for you: the type (bug, billing, question, feature request, feedback), the area of the platform, what happened (edit anything) and your device. Nothing is sent until you tap **Submit ticket**; **Not now** keeps it a draft.
- You get a ticket number (**AW-...**) and an email confirmation. The team can also see your Support Chat for context.
- Support Chat cannot be renamed, moved, pinned or deleted, so it is always where you left it.

Part 11 - Phones

- The sidebar is a drawer, the **+** menu opens as a sheet from the bottom, and the Files panel opens full width.
- Reply and chat actions are always visible on touch screens, and every button is a comfortable size to tap.
- The message box stays above the keyboard.

Part 12 - What VoxBot does not do yet

- **Lip sync, talking characters and timeline editing** are not in the chat. VoxBot gives you a plan and the link to UGC Studio or Project Studio.
- **Video edits** (upscale, background removal or reframe of a video) are done in the video tools, not the chat.
- **A character in a video** is made in UGC Studio; in chat, characters go into images.
- **Writing a whole comic script** happens in the Graphic Novel studio; the chat can draw panels for a comic you have already started.
- **Lyric videos** are made in Quick Create; after a song, VoxBot gives you the button.

- **Builds are not in the gallery.** Use the Files panel or **Download HTML**.

VoxBot can make mistakes. Check important information.

Quick reference

Thing	Number
Free messages	By plan, Fast and Smart counted separately (Part 2); resets 00:00 UTC
Paid message	Fast 1 credit, Smart 3, web search 3 each
Unlimited Fast	Artist (plus 20 Smart a day); Producer, Mogul, Ultimate (plus 200 Smart a day)
Message length	8,000 characters
Attachments	5 images + 3 files per message; images and PDFs 10 MB, songs 100 MB, videos 500 MB
Confirm card	expires in about 10 minutes, one creation per message
Builds	55 to 120 credits, charged on delivery, brief up to 4,000 characters
Projects	up to 100, names up to 60 characters; deleting one keeps its chats
Files panel	builds per chat or per project
Name	1 to 24 characters
Voices	9, default Katie
Skills	11, free; toggle in Customize VoxBot
Read aloud	30 an hour, 150 a day
Support tickets	3 a day
